Simple Profit Analysis Using Excel

A beginner-friendly data analytics project that compares total and average profit across product categories.

Project Overview

This project uses Microsoft Excel to analyze profit for products in three categories: Technology, Furniture, and Office Supplies. The workbook includes product-level profit calculations, a category-wise profit summary, and a column chart for comparison.

Objectives

- Calculate profit for each product using Sales minus Cost.
- Summarize total profit by category using SUMIF.
- Calculate average profit by category using AVERAGEIF.
- Visualize category profitability with a column chart.

Tools and Excel Formulas

Tool: Microsoft Excel
Profit: Sales - Cost (for example, =C3-D3)
Total Profit: SUMIF (for example, =SUMIF($A$3:$A$14,G4,$E$3:$E$14))
Average Profit: AVERAGEIF (for example, =AVERAGEIF($A$3:$A$14,G4,$E$3:$E$14))

Dataset Summary

Category	Total Profit	Average Profit
Technology	29,000	7,250
Furniture	19,500	4,875
Office Supplies	4,400	1,100

Key Insights

Technology has the highest total profit at 29,000, followed by Furniture at 19,500. Office Supplies has the lowest total profit at 4,400. These results help compare the contribution of each category.

Files Included

- Simple_Profit_Analysis.xlsx — Excel workbook containing the source data, profit summary, and chart.
- Simple_Profit_Analysis_README.pdf — project documentation.

Conclusion

This project demonstrates basic Excel data analysis skills, including formulas, category-wise summaries, and chart-based reporting.
